Cycle Count

Add it under **Inventory** module as a new tab, alongside your existing tabs.

Current tabs: Overview | SKU Master | Stock Levels | Batch & Expiry | Movements | Damaged | Adjustments

Add: Overview | SKU Master | Stock Levels | Batch & Expiry | Movements | Damaged | Adjustments | **Cycle Count**

What Cycle Count does: Admin assigns a specific zone/rack to a worker → worker goes physically and counts items → system compares physical count vs system count → if there's a difference, it raises a variance → Admin approves correction. It's basically a scheduled physical verification. Different from Adjustments because Adjustments are one-off corrections, Cycle Count is a planned scheduled process

Real example: Every Monday count Zone A. Every Tuesday count Zone B. This way the entire warehouse gets verified every week without stopping operations.

Where to Add It

Two places:

Place 1 — Inventory module as a new tab: Overview | SKU Master | Stock Levels | Batch & Expiry | Movements | Damaged | Adjustments | **Cycle Count**

Place 2 — Operations sidebar:

- Returns
- Operations (Tasks)
- Stock Transfer
- **Cycle Count** ← here too
- Invoices

Same logic as Stock Transfer — Inventory tab shows the count records and variance impact, Operations sidebar gives managers quick access to schedule counts.

Page Structure

Header Stats (4 cards):

- Scheduled Counts (planned but not started)
- In Progress (worker currently counting)
- Pending Review (counting done, variance found, waiting approval)
- Completed This Month

Main Table Columns:

- Count # (CC-001, CC-002...)
- Warehouse
- Zone / Rack / Bin
- SKUs to Count
- Assigned To (worker)
- Scheduled Date
- Status
- Variance Found (Yes/No)
- Actions

Create Cycle Count Form Fields:

- Count Name (e.g., "Zone B Weekly Count - March Week 1")
- Warehouse (dropdown)
- Count Scope — 4 options:
    - Full Zone (select a zone, count everything in it)
    - Specific Rack (select rack only)
    - Specific Bin (single bin count)
    - SKU Based (count all locations of a specific SKU)
- Select Zone / Rack / Bin (cascading dropdown based on scope)
- Assign To (worker dropdown)
- Scheduled Date
- Priority (High/Medium/Low)
- Instructions / Notes

Status Flow:

Scheduled → Assigned → In Progress → Counted → Under Review → Completed

- **Scheduled** — count created, not yet started
- **Assigned** — worker assigned
- **In Progress** — worker is physically counting
- **Counted** — worker submitted count numbers
- **Under Review** — system detected variance, manager reviewing
- **Completed** — variance approved/rejected, inventory updated

The Count Execution Screen (What Worker Sees):

When a worker opens their assigned cycle count task they see a table like this:

SKU	SKU Name	System Qty	Physical Count (input)	Variance
SKU-001	Rice 25kg	500	[____]	auto calc
SKU-002	Sugar 10kg	230	[____]	auto calc

Worker fills in Physical Count Column. Variance calculates automatically. When done, worker clicks "Submit Count."

Variance Review Screen (What Manager/Admin Sees):

After worker submits, if variance exists:

SKU	System Qty	Counted Qty	Variance	Variance %	Action
SKU-001	500	487	-13	-2.6%	Approve / Reject
SKU-002	230	230	0	0%	No action needed

Manager can:

- **Approve** — system updates inventory to 487, records a stock adjustment automatically
- **Reject** — sends worker back to recount
- **Escalate** — flag for Admin investigation (possible theft/damage)

Admin vs Manager:

Admin — can schedule counts for all warehouses, see all variances, approve all corrections, and see historical count accuracy reports.

Manager — can schedule counts only for their warehouse, approve variances within their warehouse, cannot see other warehouses.

Cycle Count Report (Add to Reports Page):

Add a new report called "Cycle Count Summary" showing:

- Count accuracy % per warehouse
- SKUs with repeated variances (problem items)
- Worker accuracy (which worker's counts have most variances)
- Monthly variance value in ₹
