PUTAWAY MODULE PAGE

What Putaway Is

After QC passes items, someone needs to physically take those items and place them in the correct bin. Putaway is that process — it tells the worker exactly where to put each item.

Page Structure

Page header stats (4 cards):

- Pending Putaways
- In Progress
- Completed Today
- Items to Putaway (total units)

Main table columns:

- Putaway # (auto generated like PUT-001)
- GRN # (which receipt triggered this)
- SKU
- Quantity
- Suggested Bin (smart suggestion)
- Assigned To (worker)
- Status (Pending / In Progress / Completed)
- Priority (High/Medium/Low)
- Created Date
- Actions

Create Putaway form fields:

- GRN Reference (dropdown — select completed GRN)
- SKU (auto-filled from GRN)
- Quantity (auto-filled)
- Warehouse (dropdown)
- Suggested Bin (auto-suggested based on your smart bin scoring — zone match, same SKU, empty bin)
- Override Bin (worker can manually select a different bin if needed)
- Assign To (worker dropdown)
- Priority
- Notes

Status flow: Pending → Assigned → In Progress → Completed

When completed — inventory gets updated automatically at that bin location.

Difference Between Admin and Manager View

Admin sees putaways across all warehouses with a warehouse filter dropdown at the top.
Manager sees only their warehouse's putaways — no filter needed, it's automatically scoped.
