SERIAL NUMBER TRACKING

Batch Tracking: Track a group of items together. 500 units of Product X, Batch B001, manufactured March 2026. If defective, recall entire batch.

Serial Number Tracking: Every SINGLE individual unit gets its own unique number. You know exactly where Unit #1 is, where Unit #2 is, who has Unit #47.

Real life example:

- You buy 10 laptops. Each laptop has its own serial number — SN-001, SN-002... SN-010
- SN-001 went to Customer A in Chennai
- SN-005 is still in Bin STR-B-R1 in Hyderabad warehouse
- SN-008 was returned by Customer C and is in damaged zone
- You can track every single one individually

Which Products Need Serial Tracking?

Product Type	Example	Why Needed
Electronics	Laptops, phones, TVs	Warranty, theft prevention
Heavy Machinery	Generators, motors	Service history, compliance
Medical Devices	Scanners, monitors	Regulatory compliance
High Value Items	Jewelry, cameras	Theft prevention
Vehicles/Parts	Engines, gearboxes	Traceability
Weapons/Defense	(if applicable)	Mandatory compliance

If WMS clients deal in ANY of these — serial tracking is mandatory.

Where to Add It

4 places need to touch:

Place 1 — SKU Master (Inventory tab)

When creating or editing a SKU, add a toggle:

Tracking Type:
No Tracking
Batch Tracking ← you already have
Serial Tracking ← add this
Both (Batch + Serial)

When Serial Tracking is ON for a SKU — every single unit of that SKU must have a serial number from the moment it enters the warehouse.

Place 2 — GRN (Goods Receipt)

When receiving a serial-tracked SKU, after entering quantity the system should ask:

"You are receiving 10 units of Laptop Pro X. Please enter or scan serial numbers."

Then show 10 input fields:

- Serial 1: [SN-001] ← worker scans or types
- Serial 2: [SN-002]
- Serial 3: [SN-003]
- ... up to 10

OR allow bulk import — paste 10 serial numbers at once.

Each serial number gets linked to:

- That GRN
- That PO
- That Supplier
- That Bin (after putaway)

Place 3 — Pick List / Outbound

When picking a serial-tracked SKU for a Sales Order, worker must scan/select WHICH specific serial number they are picking.

System shows: "Pick 2 units of Laptop Pro X from Bin STR-B-R1. Scan serial numbers."

Worker scans SN-003 and SN-007. Those two serials get linked to that Sales Order and that Customer.

This means later if Customer calls and says "my laptop is defective" — you know exactly SN-003 went to them and when.

Place 4 — New Page: Serial Number Registry (we can discuss about it)

Add a dedicated page under Inventory module — new tab called **"Serials"**

Table columns:

- Serial Number
- SKU
- SKU Name
- Current Status (In Stock / Picked / Shipped / Delivered / Returned / Damaged)
- Current Location (Warehouse / Zone / Bin)
- Received Date
- GRN #

- Linked PO #
- Shipped To (Customer name — if outbound)
- Linked SO # (if outbound)
- Return Status (if returned)

Search bar at top — search any serial number and instantly see its full history.

Serial Timeline (when you click on a serial number):

March 1 → Received via GRN-001 from Supplier ABC
March 1 → Putaway to Bin STR-B-R1 by Worker Ramesh
March 5 → Picked for SO-045 by Worker Amit
March 6 → Packed at Packing Station
March 6 → Shipped via Blue Dart TRK-9821
March 8 → Delivered to Customer Raj Enterprises Chennai

This full timeline per serial number is extremely powerful for customer service and compliance.

Admin vs Manager for Serial Tracking:

Admin — full serial registry across all warehouses, can search any serial, see full timeline, generate serial reports.

Manager — serial registry scoped to their warehouse only. Can search serials within their warehouse. Cannot see serials in other warehouses.

Summary — What to Build for Serial Tracking:

Where	What to Add
SKU Master	Tracking Type toggle (None/Batch/Serial/Both)
GRN	Serial number entry for each unit received
Pick List	Serial number scan/select when picking
Inventory tabs	New "Serials" tab with full registry (will discuss about this)
Serial detail page	Full timeline per serial number
Reports	Serial movement report, Serial status report (we will discuss and confirm this)

If we are not adding serial module under inventory module these are the options:

Option 1 — Inside SKU Detail Page When a client clicks on a specific SKU that has serial tracking ON — show a "Serials" section inside that SKU's detail page itself. No separate tab needed at all. Everything is contained within the SKU.

Option 2 — Inside Stock Levels tab Add a "View Serials" button on the Stock Levels tab next to any SKU row that has serial tracking enabled. Clicking it opens a modal/drawer showing all serials for that SKU. Zero new tabs added.
