1. SINGLE ORDER PICKING

One worker picks all items for ONE sales order completely before moving to the next order.

How It Works

- SO-001 needs: 2x Rice, 1x Sugar, 3x Oil
- Worker gets a pick list for SO-001 only
- Worker walks to Rice bin → picks 2, walks to Sugar bin → picks 1, walks to Oil bin → picks 3
- Worker brings everything to packing station
- Done. Moves to SO-002 next.

When to Use

- Low order volume (less than 50 orders/day)
- Large/heavy items (can't mix multiple orders)
- High value items (need careful handling per order)
- Cold storage items (can't keep out long)
- Custom/fragile orders

2. BATCH PICKING

One worker picks items for MULTIPLE orders at the same time in one trip around the warehouse.

How It Works

- SO-001 needs: 2x Rice, 1x Sugar
- SO-002 needs: 3x Rice, 2x Oil
- SO-003 needs: 1x Rice, 1x Sugar, 1x Oil

Instead of 3 separate trips — system combines them:

- Worker goes to Rice bin ONCE and picks 6 total (2+3+1)
- Worker goes to Sugar bin ONCE and picks 2 total (1+1)
- Worker goes to Oil bin ONCE and picks 3 total (2+1)
- Worker brings everything back and sorts into 3 separate totes/trolleys for each order

Result: Worker walked the warehouse ONCE instead of THREE times. 3x faster.

When to Use

- Medium order volume (50-500 orders/day)
- Small/lightweight items (easy to carry multiple)
- Similar orders going to same area
- E-commerce warehouses

How to Add in Veerha

When generating pick list, select **Batch Picking** strategy.

Additional fields appear:

- Batch Size — how many orders in one batch (e.g., 5, 10, 20)
- Auto Group By — Zone / SKU Similarity / Order Priority
- Assign To — one worker handles the whole batch

System automatically:

- Groups selected orders together
- Consolidates quantities by SKU
- Sorts pick sequence by bin location (closest bin first to minimize walking)
- Shows which quantity goes to which order

3. WAVE PICKING

Wave picking is Batch Picking with a TIME schedule added. The warehouse manager releases orders in "waves" at specific times during the day. All orders in one wave get picked together, then packed together, then shipped together.

How It Works

Wave 1 — 9:00 AM: All orders that need same-day delivery before 12 PM → released together → workers pick simultaneously → packed by 11 AM → dispatched by 11:30 AM

Wave 2 — 12:00 PM: All orders for evening delivery → released → picked → packed → dispatched

Wave 3 — 3:00 PM: All orders for next-day delivery → released → picked → packed → dispatched

Key Difference from Batch

- Batch = group by SKU similarity
- Wave = group by TIME + PRIORITY + SHIPPING DEADLINE

Wave picking coordinates the ENTIRE warehouse floor — multiple workers picking simultaneously for the same wave, all targeting same dispatch time.

When to Use

- High order volume (500+ orders/day)
- Multiple shifts
- Time-sensitive deliveries
- Large warehouses with many workers
- E-commerce fulfillment centers (Flipkart/Amazon style)

How to Add in Veerha

Add a **"Wave Planning"** section inside Pick Lists page. Separate sub-tab:

Pick Lists page tabs:

- All Pick Lists | **Wave Planning** | History

Wave Planning screen:

Create Wave form fields:

- Wave Name (e.g., "Morning Wave - March 30")
- Wave Type — Manual / Scheduled
- Release Time (when workers start picking)
- Cutoff Time (all orders placed before this time go into this wave)
- Shipping Deadline (when these orders must be dispatched)
- Priority Filter — Urgent only / Standard / All
- Warehouse
- Auto-assign workers — Yes/No
- Number of workers for this wave

Wave execution:

- System groups all eligible orders
- Divides work among assigned workers
- Each worker gets their portion as a pick list
- All workers pick simultaneously
- When all done — packing begins for entire wave together

For example: Wave overall progress bar: 72% complete | ETA: 11:45 AM

Admin vs Manager for Wave:

Admin — can create waves across all warehouses, see all wave progress. **Manager** — creates and monitors waves only for their warehouse.

Phases:

Phase 1 (Launch): Build Single Order + Batch Picking. These cover 90% of Indian warehouse operations today.

Phase 2 (3 months after launch): Add Wave Picking. Needed for larger clients.

Where Exactly to Add All This in UI

Current Pick Lists page — restructure like this:

Top of page — Picking Strategy selector (visible before generating):

Select Strategy:
[Single Order] [Batch Picking] [Wave Picking] [Zone Picking]

Each button click changes the form below accordingly. Different fields appear based on strategy selected.

Generate Pick List button — stays same but generates differently based on strategy.

Pick Lists table — add a "Strategy" column so you can see which strategy was used for each pick list.
